

Important Set-up Information for Mojo Tyres

The recommended pressure for running the Mojo D2 Tyre is
8 p.s.i. (as per the sticker on the tyre)

****Set-up recommendations are:**

2 - 4mm positive camber

2mm toe-out

Neutral caster

Rear Track: 1375 -1390mm

Front Track: 1145 -1195mm

****Seat Position:**

20-25 mm height over ground

90-100mm horizontal from lip to vertical plane of the back edge of the axle

215mm diagonal from lip of seat to centerline of rear axle

First Laps:

Scrub in tyres – complete 5 laps at medium pace without sliding the tyres; stop and let tyres cool; resume driving at race speed

Continually check pressures to establish a good working temperature & pressure. If pressures have increased more than 4lbs during first laps, lower pressures by 1 p.s.i before the next session.

Too higher tyre pressure over the recommended pressure will result in excessive wear

**** This set up and seat information is generic for use as a baseline with differences in chassis geometry, track conditions and weather conditions further adjustments & tuning may be required**
